Level up your phishing protection with Net Consulting's Advanced Phishing Validation Service – powered by Palo Alto and delivered from our UK Sovereign SOC.

Worried phishing emails are getting through your defences? - Don't be.

Our Advanced Phishing Validation Service will put those concerns to bed. Most email phishing systems exist as bolt-on solutions, but they can be complicated to deploy, expensive and often overkill for smaller enterprises. Our validation service offers a pragmatic means of detecting phishing while still using best of breed intelligence and technology.

Phishing has become a serious threat to companies and consumers alike, with phishing and fake emails being the number one method for all attacks online, from malware to ransomware and password theft to data breaches (86% of attacks in 2020 were phishing/fake email based).

In a phishing campaign, you are the fish and the bait is a fake email. The goal is to get you to click on the links within the email or to give away sensitive information (such as your username and password). Phishing messages will look like the real thing but are malicious - they may appear to come from a friend, colleague, customer or supplier. If you click on the links you could be directed to a fake website which downloads viruses onto your computer or phone, or steals your passwords.

Antivirus solutions are great for viruses, but are woefully inadequate when it comes to detecting phishing. Do you have protection in place, but still receive suspicious emails that bypass your filters?

With our Advanced Phishing Validation Service, you can rest easy knowing that a comprehensive set of automated checks help assure the protection of your most sensitive assets from phishing attacks – now, and for the long-term.

Our service is powered by Palo Alto's WildFire platform, a constantly evolving leading edge threat intelligence, collating data from the largest global community of users. Relax in the knowledge that your potential threats are being analysed by the best and most up to date intelligence available.

Don't be a fish.

Features & Benefits

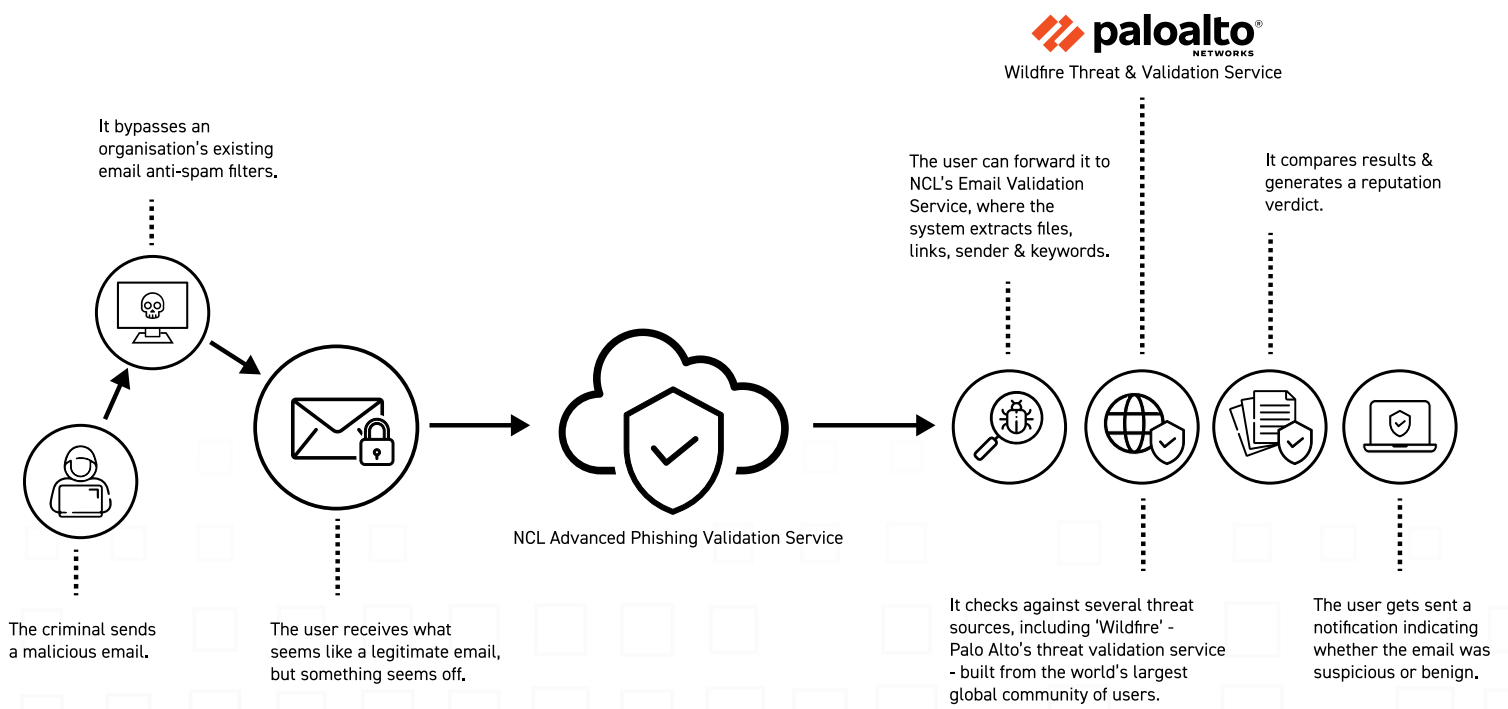

Features

- Continuous link checking
- Real-time web scanning
- Continually updated threat database
- Sender validity checking

Benefits

- Real-time notification of phishing
- Prevent fraudulent websites masquerading as legitimate websites
- Confidence that emails are genuine or false
